Search Example: IEEE Xplore Filtering

Let’s say there are too many results for your search computational grid. There are several options to remove some irrelevant results.

Search within results textbox:

If you were interested in cardiology applications, you could add the term cardi* [1] to the search by using the Search within results textbox.

Keep in mind that if a term that begins with cardi is not in the title, abstract, keywords, etc., it will not appear in the search results. The document could have information about cardiology type of applications, but the author doesn’t use the term cardiology or any other term that begins with cardi.

To add the term, type cardi* in the textbox and select the search within results button.

Additional information is available from the help within IEEE and training videos.

[1] The asterisk (*) is a wildcard or truncation character. For cardi*, any word that begins with cardi will be found.
