

## Editing a Page

To change a page in dotCMS, log in and use Website | Browser to navigate your folders and locate the page in the list of files. Note that in this case we are looking at changing the **parameters of the page itself** – *not the content*.

Right-click on the page to see a menu of options and select Page Properties

You'll start by seeing the same options you had when creating a new page:

CONTENT	ADVANCE PROPERTIES	RULES	PERMISSIONS	HISTORY
---------	--------------------	-------	-------------	---------

Title \*

Host or Folder \*

Url \*

Cache TTL \*

Template \*

Changing the Title will update the browser's title bar when viewing the page. It will also change the left-hand menu entry – if the page is set to show on the menu.

Changing the URL will change the address of the page. This is not recommended since it will **break all the links currently pointing to your page**. Contact a member of the Webteam for more details and options.

Changing the Template will give you a new layout for the page. You may need to move or re-add some elements to the page depending on the changes you make.

For Templates that make use of the left hand menu, the Advance Properties controls that function.

### Page Asset

CONTENT    **ADVANCE PROPERTIES**    RULES    PERMISSIONS    HISTORY

---

Show on Menu

Sort Order \*

Friendly Name \*

Redirect Url  
 [Select Link](#)

Checking the Show on Menu box will add this page to the left hand menu and adding a number to the Sort Order will set the position of the page in the menu.

The Redirect URL can be used to organize or consolidate pages on the site – but it can have a negative impact on the search returns. Contact the Webteam if you need a page redirected to a new location.

When you are done with your changes you can Save or Save/Publish
