Adjusting Audio Levels (Macintosh)

Please note: These instructions assume that the audio capture device will be the Audio Technica PRO 88W wireless lavalier microphone and that you are using a USB audio adapter.

1. Connect the “Phone Out” output from the microphone receiver to the USB audio adapter.

2. Open System Preferences by selecting the black Apple logo in the top left corner of the screen and selecting “System Preferences.”

3. Select the “Sound” icon.

4. Select the “Input” tab and then the “Generic USB Audio Device.”

5. Adjust the level so that the meter goes up approximately three-fourths of the way when measuring the loudest sounds.

6. The audio level is set correctly when the level meter in the Panopto Recorder averages in the middle of the green and does not move into the red even with the loudest sounds.
