Responsive Tables

Tables on webpages are great for organizing data – but are no longer the standard for arranging images as a layout tool. We’ll use Grids for the layout of the page.

If you have data you want to organize in a table on your page, follow these steps:

1. Edit the page where you want the table to appear.
2. Position the cursor where the table should be added.
3. Click the Table button to see the Insert/Edit Table window
4. Enter in the number of Columns and Rows that you need and add Cell Padding and Cell Spacing if needed.
5. Use the drop down for Class and select table or table-bordered
6. Click insert to add the table to your page
7. Click the HTML button to bring up the HTML Source Editor

Look for this line of code:

```
<table border="0" class="table-bordered">
```

Add in this bit of text:

```
table-responsive
```

to the Class – like this:

```
<table border="0" class="table-bordered table-responsive">
```

Click Update.

8. Your table is now responsive – you can add in your data and save and publish your content.

**Extra design options:**

You can highlight specific rows or cells with a background color.

In the HTML Source Editor, look for `<tr>` (for table row) or `<td>` (for table cell)

Add in a new class, like this:

```
<tr class="active"> or <td class="success">
```

Click Update to apply the changes.

You can find more examples of table styles here:
